

MASS BUILDING FOR MEN

The Complete 30-Day Guide to Diet, Exercise and Supplementation for Building Muscle

LEGS – SQUAT FOCUS

Back Squat

- With a barbell across your upper back and a braced core, slowly lower your hips back and down keeping your chest up.
- When your hip joint is lower than your knee joint, drive the weight up using your legs.
- Don't allow your knees to cave in but push them outward tracking over your toes.

Single Leg Dead Lift

- Stand tall holding a weight in your right hand.
- Hinge your hips back as you elevate your right leg straight back until it reaches parallel with the ground.
- Drive through your left heel to stand up and bring your right foot back to the ground.
- Maintain a flat back, braced core, and slight bend in your knee throughout the exercise.

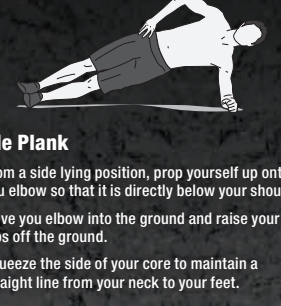

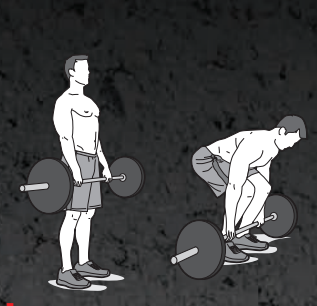

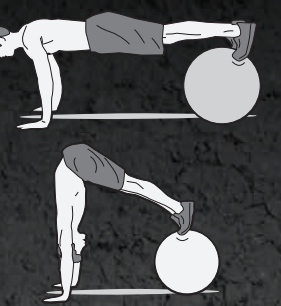

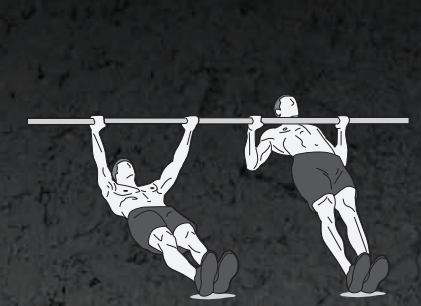

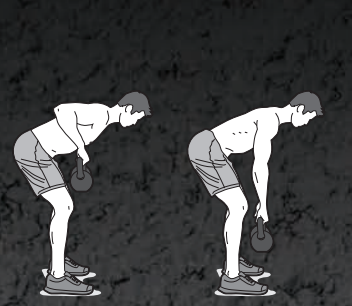

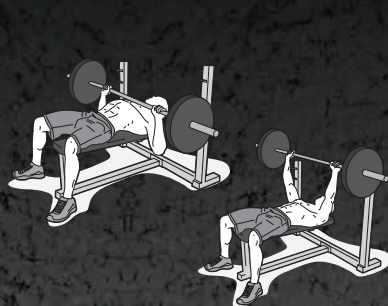

Standing Calf Raise

- Hold an anchor point at hip to chest height and feet straight, shoulder width apart.
- Drive down through the balls of your feet to elevate your heels.
- Hold the top position for a moment before lowering back down.

Farmer's Walk

- From standing, hold a heavy dumbbell in each hand and set your shoulder blades back and down.
- Walk forward, stabilizing through your core.
- Don't allow your spine to collapse and keep your head and chest up.

CHEST, BACK & ARMS

Barbell Bench Press

- Lie on a bench gripping a barbell shoulder width apart, feet firmly planted on the floor.
- Keep your elbows at 45 degrees from your sides while you lower the weight toward your chest.
- Drive the weight straight up to the starting position.
- Pull your shoulder blades together and maintain them on the bench for the entire set.

Kettlebell Bent Over Row

- Assume a hip hinge position with a braced core and flat back, holding a kettlebell in each hand.
- Squeeze your shoulder blades together and drive your elbow back to bring the weights to your chest. Lower and repeat.
- Keep your chest parallel with the ground throughout the exercise.

Inverted Row

- Position yourself underneath a bar at hip height and brace your core to maintain a straight line from your feet to your neck.
- Squeeze your shoulder blades together and drive your elbows back to pull your chest to the bar.
- Slowly lower yourself back down and continue for reps. Don't bounce off the bottom or allow your body to sag.

Swiss Ball Pike

- Start in a plank position with your feet and lower legs on a Swiss Ball.
- Using your core strength, drive your hips up until your body is in a V-shape.
- Hold the top position for a moment before lowering down. Don't allow your knees or elbows to bend or back to sag.

Deadlift

- Push your hips back, hinging at the waist with a braced core and flat back.
- Use both hands to grip either a bar or kettlebell and drive through your heels to pull the weight off the floor.
- Your shins should be vertical throughout the movement and squeeze your glute muscles at the top without over extending backward.

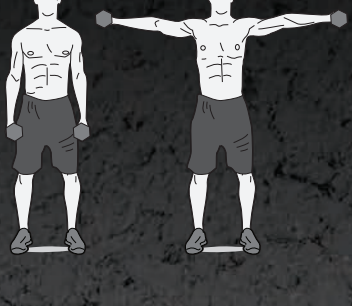

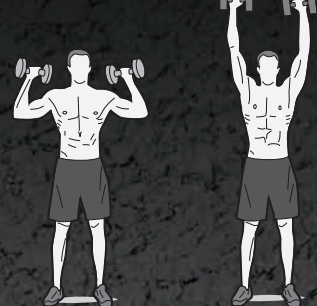

Glute Bridge

- Lie on your back with your knees bent and heels close to your hips.
- Drive through your heels and squeeze your glutes to lift your hips in the air.
- Hold the top position with a straight line from you knees to your neck for a moment before lowering to the start.

Side Plank

- From a side lying position, prop yourself up onto you elbow so that it is directly below your shoulder.
- Drive you elbow into the ground and raise your hips off the ground.
- Squeeze the side of your core to maintain a straight line from your neck to your feet.

LEGS & CORE

Shoulder Press

- Stand tall with a braced core, holding two dumbbells at shoulder height.
- Press the weights straight up using your shoulders.
- Finish with your biceps directly next to your ears before lowering back to the starting position.
- Don't allow your body to arch back, but maintain a vertical spine throughout the movement.

Lateral Shoulder Raise

- Stand tall with your shoulder blades back and down and a tight core, holding a dumbbell in each hand at your sides.
- Raise both dumbbells out to the sides until they reach parallel with the ground, then slowly lower back down.
- Do not shrug your shoulders up or bend at the elbows during the movement.

High Plank Shoulder Taps

- Assume a push-up position with hands directly below your shoulders, core tight, back flat, and feet shoulder width apart.
- Do not move your lower body, pick up one hand off the ground and slowly tap the opposite shoulder before bringing it back to the ground.
- Alternate hands as your tap the opposite shoulder.

Lying Triceps Extension

- Assume a push-up position with hands directly below your shoulders, core tight, back flat, and feet shoulder width apart.
- Without moving your lower body or hips, pick up one hand off the ground and slowly tap the opposite shoulder before bringing it back to the ground.
- Alternate hands as you tap the opposite shoulder.

THE PROGRAM

Adding lean muscle mass is a strategic process that takes the right combination of volume, nutrition, and intensity. It's more complicated than just lifting heavy and cramming in the calories. This 30-day guide will give you the tools to pack on high quality muscle without adding fat.

It will cover nutrition and eating strategies to ensure your body is building as much muscle as possible. You'll learn the best supplements to quickly add pounds of muscle to your frame, and how to adopt the best muscle-building mindset for your goal.

You'll discover the ultimate combination of muscle building exercises, set and rep schemes, and programming to bulk up over the next 30 days. Prepare to work hard, train smart, and build slabs of lean muscle that will have you looking your best.

MINDSET AND GOALS

This 30-day guide has been prepared to kick-start the process of building lean mass. Think of it as a road map for the next thirty days, but understand that these principles are yours to apply whenever you want to bulk up or add muscle.

It's best to cycle through bulking periods, so use this guide for your next cycle, and commit vigorously to the nutrition, supplementation, and exercise programming for the weeks ahead. With this strategy it's possible to add 10 pounds of lean muscle in thirty days. Remember that every workout you miss, meal you skip, and unhealthy vice you manage will take you further from your goal.

NUTRITION

Because mass gain is your goal, nutrition has to be the foundation of your program. You can use the best exercises, rep/set schemes and loads, but if you're not taking in enough calories, you'll never reach the size goals you want. Also, you can't just take in anything you want, because not all calories are created equal. To gain lean, quality muscle mass, you have to take in the right macronutrients and eat at the right times.

Calories and Macronutrients

To build lean muscle you need to consume significantly more calories than you burn. A good rule of thumb is to multiply your weight in pounds by 20 to find the amount of calories you'll need to eat on a daily basis. Then, of those calories you'll need 1.5 grams of protein per pound of bodyweight, 3 grams of carbohydrates per pound of bodyweight, and roughly 0.5 grams of fat per pound to lay down lean muscle.

Try to consume the most nutrient-dense foods as possible to reach these calorie requirements. For protein, focus on lean cuts of meat including beef, chicken, eggs, and fish. High-quality sources of carbohydrates include fruit, vegetables, rice, and potatoes. Good, healthy fats include salmon, walnuts, avocado, and fish oil.

Timing and Frequency

To create the best opportunity to build muscle, when you eat is almost as important as what you eat. Certain eating times will spark your body to use food to repair and build muscle, and optimize muscle-building hormones. Shoot for three solid meals per day with two or three additional snacks/shakes to reach your caloric needs and optimize nutrient timing.

You'll want to take in high-quality protein and some fast-acting carbs as soon as you wake up. This will prevent your body from using its own valuable muscle tissue for fuel, and use the nutrients you provide it instead.

Pre- and post-workout are maybe the most important times to take in protein and carbs. This is when your body is looking for fuel to build muscle and replenish what you've broken down during exercise. Remain diligent about consuming nutrients at these times.

The final time to eat is right before bed, with a slow-digesting protein that will provide the fuel your body needs to rebuild overnight. This will also prevent your system from breaking down, or catabolizing, muscle tissue while you sleep.

EXERCISE AND PROGRAM

To build new muscle, you must accumulate time under tension. This will elicit the muscles to break down and rebuild bigger and stronger. Rep counts and tempo will be the training tools used to accomplish this. It's also best to use loads around 60% of your one-rep max for muscle gain, or "for hypertrophy". This ratio will ensure that enough intensity is being applied to spark new muscle growth.

Training Frequency

You will train four times per week and sessions consist of two upper body days and two lower body days. This will allow you to get adequate volume in each week without overtraining. You will train two days on, then one day off, then two days on again before resting for at least two more days. In other words, you can train two on, one off, two on, two off, and repeat. Your sessions should not take longer than one hour, including warm-up and cool-down.

Rest

Changes to your body happen when you are at rest. The body repairs, restores, and lays down new muscle during sleep. So make deep, quality sleep a priority while working to build muscle. Seven to nine hours of sleep per night is recommended, as are three recovery days per week. Don't do extra work on your days off. Use them to recover fully, or go for a light walk.

TRAINING PROTOCOLS

Supersets

Supersets allow you to accumulate a lot of volume using heavy loads without completely burning out a muscle group. They require you to exercise opposing muscle groups back-to-back with minimal rest. This type of training has a profound effect on your endocrine system and sparks a release of growth hormone, which will help build new muscle. It will also keep your heart rate up and help you burn fat. Rest 3 minutes or less between exercises and 60 seconds between sets.

Drop Sets

Drop sets are a great way to fatigue your muscles, add volume, and get an impressive pump at the end of a set. After your last working set, immediately reduce the weight by 10-30% and continue for more reps. This will allow you to get into the deep muscle fibers and elicit the appropriate response to make them grow.

Eccentric Training

The most muscle damage happens during the eccentric (weight-lowering) phase of an exercise. Since hypertrophy is our goal, we need this kind of muscle damage to cause the muscle to rebuild and enlarge itself. For each rep, focus on a four-second eccentric phase, a one-second pause at the bottom, followed by an explosive concentric (weight-raising) phase, as quickly as possible, with a one-second pause at the top.

Exercise Selection

To be efficient, we want to use compound exercises or exercises that use multiple joints, as opposed to a single joint. This will allow us to hit the greatest number of exercises, spark the strongest endocrine response, and ultimately build the most muscle. Examples of compound movements are squats, deadlifts, presses, and pulls. These are also functional movements that will make you stronger and translate well into athletics.

SUPPLEMENTATION

To see the best results, you must do your best to fuel your body with the most nutritious foods and follow an eating strategy for your goal. Supplements, however, are there for when your diet falls short, and to boost your efforts toward losing fat. Thanks to modern research we understand the benefits of certain vitamins, minerals, and nutrients. We also know that our bodies can't produce everything they need to thrive on their own. Supplements will give your body the best shot at quickly achieving your goal and optimizing your health and performance.

Horse Power X

This potent combination of 11 premium workout enhancers will provide the fuel you need to power through workouts with optimal energy, maximum gains, and no pit stops. It's among the most well-rounded pre-workout supplements on the market today. Leave the Sunday driving to others. Kickstart your routine and make Horse Power® X part of your training regimen.

Iso Mass

It is no longer necessary to buy all your supplements separately. Ultimate Nutrition® is pleased to introduce IsoMass Xtreme Gainer® to "hard gainers" everywhere. With a carbohydrate to protein ratio of 16:13, IsoMass Xtreme Gainer® is designed to help you gain serious muscle mass without the added fat deposits.

Muscle Juice Revolution

Ultimate Nutrition Muscle Juice® Revolution 2600 is the most advanced weight gainer on the market. It features 56 grams of protein per serving. It also contains 170 grams of time-release carbohydrates to extend digestion time and minimize bloating.

Whey Gold

Protein plays a number of different roles in the body, including the repair of cells, building muscle and bone, providing energy, and controlling many important metabolic processes. Whey protein is a high-quality protein, with a large variety of essential and non-essential amino acids. Your body requires higher amounts of these amino acids during and following exercise, making Whey Gold is the perfect post-workout drink.

Flavored BCAA 12000

Branched-chain amino acids include leucine, isoleucine and valine. These amino acids are needed to maintain muscle tissue during physical stress and intense exercise. From the perspective of athletes, BCAAs function as anabolic agents and induce sparing, which helps the body avoid burning muscle.

Other supplements to consider

include: Super Complete Formula, Glutapure, GABA, Omega 3 and Vegetable Greens

Ultimate Nutrition® is committed to providing athletes with products that work.
