

Ultimate Nutrition

SUPER MULTI CAPSULES

People are not getting proper nutrition from their diets! This is especially the case with the aging population as well as children who are alarmingly hooked on the so-called junk food. It may be the result of our hectic lifestyle, and the claims that our professional, family and social life lay on us.

Recognizing this disturbing trend, Ultimate Nutrition has designed a full-spectrum product that provides all the essentials to promote good health. This unique formulation is rich in antioxidants, vitamins, and trace minerals, which are required for optimal body function.

Antioxidants: It is no exaggeration to say that we are increasingly inundated with free radicals. Free radicals are the most pernicious entities produced in the body in the wake of normal metabolism. Even though the body is equipped to handle a certain load of free radicals, it is when more free radicals are produced than the body can handle that nutritional antioxidants become extremely important. Free radicals are implicated in numerous diseases. What is more, the aging process itself is driven by excess free radicals. Therefore, to hold these injurious molecules in check, it is extremely important not only to enjoy good health, but also to hold the aging process at bay. Super Multi contains a wide range of antioxidants that effectively scavenge for free radicals, and nip them in the bud. Super Multi contains all the requisite antioxidants that function in various tissues to optimize health, including beta-carotenes, lutein, zeaxanthine, rutin, hesperidin, and several other bioflavonoids that work together with both fat and water-soluble vitamins.

Vitamins: Vitamin deficiency is almost always associated with many illnesses. For example, a decrease in the B vitamins has been linked to stress and the lack of a sense of general wellbeing. With our hectic lifestyles, we are not getting the sufficient amounts of vitamins from the diet. Anticipating this need, Super Multi contains the most important B vitamins in addition to vitamins C, D and E. Of course, vitamins C and E are also potent antioxidants and work in concert with each other to neutralize free radicals that can pose a hazard to normal health.

Minerals: As important as antioxidants are, the body also needs trace minerals for normal physiological function. The case of selenium illustrates the need for dietary supplementation with trace minerals. Most populations worldwide receive a sufficient supply of selenium from their diets. In the United States, however, the amount of selenium in the diet is woefully low, which may be due to topsoil erosion. Selenium is an important trace mineral that functions both as an antioxidant and a preventive agent in the abnormal growth in the body. Super Multi contains trace minerals and more abundant minerals to stimulate the body's own defense responses. In addition, minerals such as calcium and magnesium are required for absorption of amino acids and other nutrients in the body to maintain optimal metabolic function.

Amino Acids: To ensure that the metabolism remains active, Super Multi incorporates amino acids, such as glutamic acid and PABA, (para-amino benzoic acid), and precursors of amino acids, such as betaine hydrochloride. Glutamic acid has been shown to be a valuable dietary supplement in boosting the immune system. Furthermore, if ingested on an empty stomach and combined with a reasonable exercise routine, it induces the secretion of growth hormone that, over time, may reduce body fat and increase lean body mass.

Betaine hydrochloride, on the other hand, serves as a precursor to derivatives of the amino acid methionine, which are involved in the synthesis of vitamins B in the body, including the brain. Additionally, methionine precursors help reduce the amounts of homocysteine that contributes to coronary heart disease. Betaine hydrochloride allows the body to synthesize all the beneficial compounds that it needs in the right amount at the right time.

Ultimate Nutrition's Super Multi packs the punch. It delivers antioxidants, vitamins, minerals and amino acids that work together to stimulate the myriad reactions in the body to promote good health for enjoyment of life to the fullest.

FREQUENTLY ASKED QUESTIONS

1. Do Various Vitamins and Minerals Work Together?
In a majority of cases, vitamins and minerals do work together and may even reinforce each other's biological activities.
2. Are Fat-Soluble and Water-Soluble Vitamins Effectively Absorbed?
Yes! The absorption rate may vary depending on the vitamin, but there is no biological barrier in simultaneous absorption of fat- and water-soluble vitamins.
