Amino Bolic

Amino acids are the building blocks of proteins and muscle tissue. All types of physiological processes relating to sport; such as energy, recovery, muscle gain, strength gain and fat loss are closely and significantly linked to amino acids. Amino acids have become a major part of athletes' supplementation, especially among bodybuilders. Amino acids are needed to maintain and repair muscles, tendons, skin, ligaments, organs, etc. They also aid in the production of hormones, neurotransmitters, and enzymes that play a role in various bodily functions.

When even one amino acid is deficient, health problems may occur. Eating highly nutritious, high protein meals is the most familiar way to get amino acids into the diet. Even some vegetables and legumes can offer high levels of most amino acids. However, for serious athletes and those on the run, protein supplements and pure free-form amino acids provide a convenient and effective way to supplement dietary needs.

Ultimate Nutrition Amino Bolic is a free-form amino acid complex that supplies several of the amino acids most needed by the body, in easy to swallow (and easy to take along to the gym) caplets. The benefits of using free-form amino acids are that because they're small molecules they are much easier to digest and absorb while exercising, and they don't cause bloating or gas.

With Amino Bolic you get:

- Increased protein synthesis and recovery rate
- Over 6000mg of Leucine per serving to blast your body into an anabolic state
- Reduced muscle breakdown resulting from exercise
- Increased caloric efficiency for more muscle with less fat
- Reduced fatigue and soreness
- NO STIMULANTS!

As athletes know, physical activity and bodybuilding has distinct effects on protein metabolism. Recent studies indicate that amino acid supplements can increase muscular development, particularly when involved with heavy resistance training. Research on amino acid supplements show that athletes achieve muscular strength much quicker and experience less physical exhaustion while taking amino acid supplements or amino acid rich foods. Amino acid supplements can benefit all athletes as well as anyone wanting to ensure a balanced diet.

Amino Bolic includes BCAA's. BCAA's act as a fuel source for skeletal muscle during times of trauma or stress and help prevent catabolism, all while encouraging protein synthesis. The BCAA's are especially important to athletes because they are metabolized in the muscle rather than the liver. This means that they can be used either to build new

proteins or be burned as fuel to create energy. Supplementing with BCAA's has been shown to result in measurable gains in both muscle strength and size. Taken before a workout BCAA's can improve performance and delay the onset of fatigue. They also operate as anabolic agents allowing the body to burn fat and not muscle.

From vegetarians to people with protein allergies, the stressed to the mentally fatigued, bodybuilders to endurance athletes - for anyone who may not be getting a balanced diet in amino acids, Amino Bolic can offer the powerful nutrition tool you need.

Frequently Asked Questions:

1. What are the potential advantages of taking leucine?

Leucine works as part of the BCAA's group to repair muscles, regulate blood sugar, and provide the body with energy. It also increases production of growth hormones, and helps burn visceral fat. Leucine, isoleucine, and valine are branched-chain amino acids (BCAAs), and all three of them help promote muscle recovery after exercise. Leucine is the most effective BCAA for preventing muscle loss because it breaks down and is converted to glucose more quickly than isoleucine and valine.

2. What are Amino Acids?

Amino acids are the structural building blocks of protein. They are found in protein rich sources, such as meat and fish. Amino acids form the basic components of all living cells, found in virtually every part of the body. They are essential for the maintenance, growth and repair of muscle tissue.

3. Could One Be Deficient in BCAA's?

Periods of intense physical stress, such as intense weightlifting and long-distance running, can create a so-called catabolic state in which muscle tissue is broken down faster than it can be recovered and replenished.
