ECHINACEA LIQUID EXTRACT

Herbalists consider Echinacea one of the best blood purifiers and an effective antibiotic. It activates the body's immune system increasing the chances of fighting off any disease. This popular herb has been used to help ward off the common cold and to relieve the symptoms of hay fever. Since the early 1900's hundreds of scientific articles have been written about Echinacea. Most of the research during the past 10 years has focused on the immunostimulant properties of the plant.

Echinacea properties may offer benefit for nearly all infectious conditions. Studies show Echinacea prevents the formation of an enzyme that destroys a natural barrier between healthy tissue and damaging organisms. Echinacea is considered an effective therapeutic agent in many infectious conditions including upper respiratory infections, the common cold and sinusitis. The herb is a mild antibiotic that is effective against staph and strep infections.

Overall, across the hundreds of Echinacea studies from the lab to the clinic, evidence from at least a dozen clinical trials shows that Echinacea is effective in either treating or preventing upper respiratory tract infections – otherwise known as colds and flu. Among the clinical studies showing a beneficial effect of Echinacea extracts in promoting immune function in human subjects, supplements have been shown to accelerate recovery from cold symptoms and reduce the incidence of cold-related infections. In most cases, cold and flu symptoms resolve 1-4 days earlier in subjects taking Echinacea when compared to those taking a placebo.

Echinacea's antibacterial properties can stimulate wound healing and are of benefit to skin conditions such as burns, insect bites, ulcers, psoriasis, acne and eczema. It's anti-inflammatory properties may relieve arthritis and lymphatic swelling.

Ultimate Nutrition's Concentrated Echinacea Drops are prepared from the fresh (undried) roots of wild Echinacea Purpurea and Echinacea Angustifolia which are organically grown without the use of chemical fertilizers, pesticides, or herbicides. They are harvested at their optimal potency and promptly formulated while still fresh and succulent. The ability of Echinacea to stimulate the immune system is extremely well documented. The primary constituents responsible for its activity are large sugar molecules called polysaccharides. Echinacea has been thoroughly demonstrated to reduce the duration and severity of common cold and flu symptoms. It also has direct antibacterial properties. 1 : 1 ratio Dry Herb to liquid carrier. Sublingual (under the tongue) liquid form is absorbed by the body quicker.
