CLA

Dr. Michael Pariza first identified CLA at the University of Wisconsin-Madison in 1978. For several years he studied an extract from beef and dairy fats that demonstrated anti-cancer properties. This initial research showed how CLA helps reduce body fat and increases lean muscle tissue. Since this initial finding, a surge of scientific studies and research has identified many other beneficial health properties with CLA. Over the past two decades more than 200 studies have been published illustrating numerous health applications for CLA.

CLA (conjugated linoleic acid) is a an omega 6 fatty acid that was first discovered in the early 80s that continues to be studied for its diverse applications in promoting good health. CLA is made through a process that converts the linoleic acid derived from safflower oil to conjugated linoleic acid. CLA is a naturally occurring fatty acid found in our diet and since the body cannot produce this fatty acid it can be obtained only through the diet. CLA is best known as an effective product for reducing body fat and increasing lean muscle mass resulting in an improved body shape. Following digestion, CLA is absorbed and metabolized by the body, as are all types of oils. Studies in animals and humans have shown that if the amount of CLA in the diet is increased this will result in an increase in the CLA levels in the body tissues.

CLA helps reduce body fat while increasing lean muscle mass and may help you lose inches in your abdominal area. CLA can help you achieve your diet goals in two ways: first, CLA reduces the amount of fat you store after eating. Second, CLA decreases the amount of fat stored in your body. The result is as you diet; you may drop a clothes size or two without the dreaded yo-yo effect of losing and regaining weight. This is because you're reducing body fat, not water which is a more permanent and healthy loss.

Studies have shown that CLA inhibits lipoprotein lipase, an enzyme that breaks down fat from our diet so that it can be absorbed and stored in the body. By suppressing this enzyme, CLA helps reduce the amount of fat deposited and stored throughout the body. To summarize, studies have shown that CLA reduces body fat in four ways:

- By decreasing the amount of fat that is stored after eating
- By increasing the rate of fat breakdown in fat cells
- By increasing the rate of fat burning
- By decreasing the total number of fat cells

CLA works to reduce body fat by preventing fat accumulation in fat cells. Fat normally enters the fat cell through a "door" that is controlled by an enzyme. By acting on this enzyme, CLA keeps the "door" locked. When the "door" is locked, fat cannot enter the

cells thereby not allowing the amount of fat to increase in the cells. The less fat that is present in the cells, the smaller and less mature they become, this helps to reduce the level of fat in the body. The increased breakdown of fat helps to fuel and preserve muscle mass, which in turn increases lean muscle mass and results in weight loss.

FREQUENTLY ASKED QUESTIONS:

1. What is an effective amount of CLA?

To achieve optimal benefits from CLA, it is best to consume 3g per day in combination with a healthy diet and regular exercise. To reach the optimal daily dosage of CLA, one can supplement the diet with one CLAPure softgel with each meal.

2. Is CLA safe and are there any side effects?

CLA is safe. No adverse side effects have been observed with the recommended dose. Used as part of a healthy lifestyle, CLA can effectively aid in reducing fat and building lean muscle mass. Ultimate Nutrition's CLAPure CLA does not contain any natural or artificial stimulants. In addition, CLAPure CLA has many other equally important health benefits make it a sound supplement choice for better overall health.

3. Is there anything I should avoid combining with CLA?

Do not take chitosan and CLA together. The chitosan will absorb the CLA and prevent it from getting into the bloodstream.
