

Ultimate Nutrition

Iso Meal Xtreme

Ultimate Nutrition Iso Meal Xtreme is the future of meal supplements*. It is the first complete meal supplement designed with whole grain oats and isolated proteins*. Ultimate Nutrition Iso Meal Xtreme is further enhanced with free-flowing BCAAs, glutamine, essential fatty acids, and fiber, as well as a complex vitamin and mineral blend.

WHY WHOLE GRAIN OATS?

Whole grain oats are complex carbohydrates that your body processes into hours-long fuel for your muscles*. Whole grain oats contain beta-glucan, a specific type of fiber that has been shown to have a beneficial effect on cholesterol levels*.

WHAT ARE THE HEALTH BENEFITS OF FIBER?

You may be familiar with fiber because of its digestive regulatory function*. Fiber also provides many other health benefits*. Eating a higher-fiber diet, as part of an overall healthful lifestyle, may play a role in attaining a healthy BMI (body mass index)*. Research has shown that people with high fiber, low fat diets are less likely to be overweight than those who follow low fiber, high fat diets*. Research further shows that most of us do not come close to the recommended intake of 20 grams to 35 grams of fiber a day*.

WHY IS PROTEIN IMPORTANT?

Protein is essential for bodybuilders, athletes, those trying to lose weight, and, well, pretty much everyone*! As you work out, your protein level decreases. Protein supplements will allow your muscles to increase in size and recover faster*. For those trying to lose weight, an increase in protein intake can result in decreased appetite and increased weight loss*. Ultimate Nutrition Iso Meal Xtreme contains only isolated proteins, so you get more protein per gram.

WHY SHOULD I TAKE BCAAS AND GLUTAMINE?

Supplements with branched chain amino acids (leucine, isoleucine, and valine) and glutamine are important for muscle recuperation, muscle energy, repair of damaged muscle tissue, and increase in muscle growth*.

WHAT ARE ESSENTIAL FATTY ACIDS (EFAs)?

Essential fatty acids (ALA, DHA, and EPA) are not produced by the body and must be acquired through food*. Ultimate Nutrition Iso Meal Xtreme contains canola, CLA, omega 3, and medium chain triglycerides, all of which are healthy essential fatty acids*. They assist in energy production and also have been shown to improve cardiovascular and brain health*.

HOW DO DIGESTIVE ENZYMES INCREASE NUTRIENT UTILIZATION?

Digestive enzymes help absorb and break down nutrients not easily digested in the body*. They can play a key role in everyday activities*. In order for amino acids to be effectively used by the muscles, digestive enzymes accelerate their availability and absorption*.

FREQUENTLY ASKED QUESTIONS:

1. Do people really need vitamin supplements?

Nutrients are vital for healthy functioning organs, skin and eyesight, strong bones, nervous system and general wellbeing. Long-term deficiencies can cause poor health. Demanding work schedules, exercise and some lifestyle habits can also be punishing on the body and increase the need for vitamins and minerals. A balanced diet may not always deliver the needed vitamins and minerals due to some food production, as well as farming and processing methods. Of course foods contain a broad range of micro & macronutrients, so it is always important to consume healthy foods, and fresh fruits and vegetables. However, scientific studies have proven that a good diet may no longer be good enough for optimum health and disease prevention.

2. What are the nutritional benefits of canola?

Canola is recognized for its nutritional attributes as it contains the lowest level of saturated fatty acids of any vegetable oil. It is high in monounsaturated fatty acids, which have been shown to reduce blood cholesterol levels, and has moderate amounts of essential polyunsaturated fatty acids. Like all vegetable oils, canola oil is cholesterol-free. Nutritional research is confirming that the fatty profile of canola oil appears to be beneficial in preventing and treating coronary heart disease risk factors including high blood cholesterol and lipid levels as well as thrombosis.

3. Who benefits from protein?

Protein is an important nutrient needed by everyone on a daily basis. It is made up of essential and non-essential amino acids, which are the "building blocks" for healthy bodies. Protein has a number of different roles in the body including repairing body cells, building and repairing muscles and bones, providing a source of energy, and controlling many of the important processes in the body related to metabolism. Whey protein is a high quality, complete protein, with all the essential amino acids. Whey protein is also the richest known source of naturally occurring branched chain amino acids (leucine, isoleucine and valine). These are important for active individuals, individuals who exercise and professional athletes. Many athletes consume a whey beverage both before and immediately after exercise or an event to help repair and rebuild lean muscle tissue.
